

DRVS UDS Validation Checklist – Table 6b HIV

Unmapped but Available Data

In the DRVS Mapping Administration, check for unmapped source EHR values for the below mapping categories:

- Structured Clinical Data – Initiating Treatment for HIV
- Service Line – Primary Care
- Service Line – Specialty

Unknown or Unavailable Data

All of the above Structured Clinical Data items could have multiple sources in your EHR. If you do not see “Source EHR Text” corresponding to each possible workflow for a given data point, open a ticket with a patient example at support@azarahealthcare.com to have it mapped.

Questionable Data

The “Completed Lab Volume” measure when reviewed for the below lab types can help identify low counts of lab results for given periods to determine if there are labs without LOINC codes assigned.

- HIV
- Viral Load

As the “HIV Screening” measure is an all-time lookback, be sure to set the period to “Year 2020” in order to see the most historical data.
